CHAPTER 2 Protein Structure 31 Side Chains with Polar but Uncharged Groups Six amino acids have side chains with polar groups (FIGURE 2.4). Asparagine and glutamine are amide derivatives of aspartate and glutamate, respectively. Serine, threonine, and tyrosine have side chains with hydroxyl (OH) groups.

### **SECTION Protein Structure and Function I**

Catalysis is the process of increasing the rate of a chemical reaction by adding a substance known as a catalyst, which is not consumed in the catalyzed reaction and can continue to act repeatedly. Because of this, only very small amounts of catalyst are required to alter the reaction rate in principle. In general, chemical reactions occur faster in the presence of a ...

A hormone (from the Greek participle *hormō*, "to set in motion, urge on") is any member of a class of signaling molecules produced by glands in multicellular organisms that are transported by the circulatory system to target distant organs to regulate physiology and behavior. Hormones have diverse chemical structures, mainly of 3 classes: eicosanoids, steroids, and amino acid ...

K<sub>1</sub> and K<sub>2</sub> are the equilibrium constants of the two dissociation reactions. In literature, some studies on the solubility of amino acids in water have been carried out. Dalton and Schmidt calculated solubilities of certain amino acids in the temperature range of 0–100 °C. Tabulated solubility data of amino acids in water can also be found in several handbooks, .

The MTHFR gene provides instructions for making an enzyme called methylenetetrahydrofolate reductase. This enzyme plays a role in processing amino acids, the building blocks of proteins. Methylenetetrahydrofolate reductase is important for a chemical reaction involving forms of the vitamin folate (also called vitamin B9).
